Task 5: Recommendations & Experiments

Based on the analysis, here are three actionable recommendations with experiments to validate them.

Recommendation 1: Fix the Activation Flow

Problem

60.5% of signups never subscribe. Users are signing up but not experiencing enough value to convert.

Hypothesis

Users who complete a guided onboarding flow within their first session will subscribe at a higher rate than users who explore independently.

Experiment

- Control: Current onboarding (self-guided exploration)
- Variant: Guided 3-step onboarding (name site, install banner, customize design)

Metrics to Track

- Primary: Subscription rate (% of signups who enter a trial)
- Secondary: Time to first feature use, 7-day retention

Expected Outcome

Subscription rate increases from 39.5% to 45%+, adding ~275 subscribers from current signup volume.

Recommendation 2: Pause Campaign C and Reallocate Budget

Problem

Campaign C has the lowest ROAS (0.09x) despite highest spend ($263K). Every dollar spent returns only $0.09.

Hypothesis

Reallocating Campaign C budget to Campaign B (best CPA at $13.58) will generate more conversions at lower cost.

Experiment

- Phase 1 (Week 1-2): Pause Campaign C
- Phase 2 (Week 3-4): Reallocate $50K to Campaign B
- Phase 3 (Week 5-8): Measure total conversions and cost per acquisition

Metrics to Track

- Primary: Total conversions, cost per conversion
- Secondary: Revenue, ROAS by campaign

Expected Outcome

Save $263K in wasted spend. Increase total conversions by 15-20% through better-targeted Campaign B spend.

Recommendation 3: Fix Invoice Failures

Problem

24.7% of invoices fail (417 of 1,690). This represents significant revenue leakage.

Hypothesis

Implementing automated dunning — card retry logic, payment method update prompts, and proactive outreach — will reduce failure rate and recover lost revenue.

Experiment

- Control: Current billing process (no automated retry)
- Variant: Automated dunning (retry failed payments, notify users, offer payment update)

Metrics to Track

- Primary: Invoice failure rate (target: reduce from 24.7% to 15%)
- Secondary: Recovered revenue, churn rate (involuntary churn should decrease)

Expected Outcome

Reduce failure rate by 10 percentage points, recovering $27K+ annually in failed payments.
