

CookieYes Product Analytics

Executive Summary

CookieYes is a SaaS platform that helps websites comply with cookie regulations. This analysis examines 5,010 user accounts across 4 months to identify what drives growth, conversion, retention, and revenue.

Three critical findings:

1. 60.5% of signups never subscribe. The biggest growth blocker is moving users from signup to trial.
2. Campaign C is losing money. It has spent \$263K and delivered the lowest ROAS (0.09x), generating only \$24K in revenue.
3. Invoice failures are leaking revenue. 24.7% of invoices fail, representing potential lost income.

Three priorities for the next 90 days:

1. Fix the activation flow to convert more signups into subscribers
2. Pause Campaign C and reallocate budget to better-performing campaigns
3. Implement dunning automation to recover failed payments

Task 1: Product Understanding & Data Preparation

CookieYes User Journey

CookieYes is a Cookie Consent Management Platform (CMP) that helps websites comply with privacy regulations (GDPR, CCPA, etc.) by providing cookie consent banners, scanning, and compliance tools.

User Journey Stages

Stage Definitions

Stage	Definition	Key Events	Success Metric
Acquisition	User discovers CookieYes and signs up	Ad click, landing page visit, signup	Signups by source
Activation	User completes onboarding and starts using the product	Account created, first feature use, banner installed	Activation rate
Conversion	Trial user becomes a paying customer	Trial starts, trial ends, payment	Trial-to-paid conversion rate
Retention	User continues to stay active as a paying customer	Subscription active, renewals, feature usage	Retention rate (30/60/90 day)
Revenue	User generates subscription revenue for the business	Payment, renewal, expansion	MRR, ARPU, LTV

Key Metric Definitions

Acquisition Metrics

1. Signup: Account created in accounts.csv
2. Signup Source: utm_source (Google Ads, LinkedIn, Organic, Referral)
3. Signup Campaign: utm_campaign (Campaign_A, Campaign_B, Campaign_C)
4. Account Type: agency (manages multiple clients) or normal (single website)

Activation Metrics

1. Activation Event: First feature_use event in server_events.log
2. Activation Rate: % of signups who use at least one feature within 7 days
3. Key Features: cookie_banner, policy_generator

Conversion Metrics

1. Trial: Subscription with is_trial = true
2. Trial Conversion: conversion_flag = 'yes'
3. Conversion Rate: Trials converted / Total trials
4. Time to Convert: Days from trial_start to first payment

Retention Metrics

1. Active Subscription: status = 'active'
2. Churn: status = 'canceled'
3. Churn Rate: Canceled / Total subscriptions
4. Cohort Retention: % of users from signup cohort still active after N days

Revenue Metrics

1. MRR (Monthly Recurring Revenue): Sum of active subscription amounts per month
2. ARPU (Average Revenue Per User): MRR / Active users
3. LTV (Lifetime Value): ARPU / Monthly churn rate
4. CAC (Customer Acquisition Cost): Marketing spend / New customers

Dataset Join Strategy

How Datasets Connect

Data flow: source accounts file branches to intermediate datasets, then combines into ad performance output.

Assumptions

Data Assumptions

1. Activation Definition: A user is "activated" when they use either `cookie_banner` or `policy_generator` feature
2. Conversion Definition: A user "converted" if `conversion_flag` = 'yes' in subscriptions
3. Churn Definition: A user "churned" if `status` = 'canceled'
4. Revenue Period: Analysis covers June - September 2025 (4 months of data)
5. Missing Values: Empty `account_ids` in events are treated as anonymous visitors
6. Currency: All invoice amounts treated as USD equivalent for revenue calculations

7. Campaign Attribution: `utm_campaign` links accounts to ad campaigns

Business Assumptions

1. Free Plan: Users on free plan are not counted in revenue metrics
2. Trial Period: 14-day trial (standard for SaaS)
3. Monthly Billing: Default billing cycle unless `plan_type = 'yearly'`
4. Agency Accounts: May have multiple subscriptions (one per client)
5. Referral Quality: Referral users assumed to have higher intent
