

District CRM Growth & Lifecycle Orchestration Concept

Role Applied For: Assistant Manager – CRM, District by Zomato

Submitted by: Fazil A | fazilabbaz@gmail.com | 8075833967

I’ve created a conceptual prototype that showcases how an AI-first CRM operating model could help District drive activation, retention, reactivation and customer lifetime value.

Problem Statement

Consumer apps often face four major challenges:

1. Activation: Users install but never complete a meaningful action.
2. Retention: Users stop engaging after initial usage.
3. Reactivation: Dormant users are difficult to bring back.
4. Communication Fatigue: Overuse of channels reduces engagement over time.

The prototype explores how District could address these challenges through segmentation, journey orchestration, experimentation and AI-assisted decision making.

Prototype Overview

The prototype consists of five connected modules:

1. **CRM Overview Dashboard** - Provides visibility into:
 - Installs
 - Active users
 - Dormant users
 - Funnel conversion
 - Retention metrics
 - Channel performance

Purpose: Identify lifecycle bottlenecks and growth opportunities.

2. **Audience Segment Explorer** - Allows creation of behavior-based cohorts using:
 - Activity recency
 - Lifetime value
 - Engagement signals
 - Churn indicators
 - Booking history

Purpose: Deliver targeted communication instead of broad campaigns.

3. **Lifecycle Journey Builder** - Visual workflow builder containing:
 - Triggers
 - Decision branches
 - Delays
 - Multi-channel communication nodes
 - Exit conditions

Purpose: Convert user intent into automated lifecycle experiences.

4. **Campaign Composer & Personalization Studio** - Allows CRM managers to:
 - Select audiences
 - Define objectives
 - Choose communication channels
 - Personalize messaging
 - Preview customer experiences

Purpose: Increase engagement through relevant and contextual communication.

5. **Experimentation & AI Strategy Room** - Provides:
 - A/B testing workflows
 - Statistical confidence reporting
 - Next-best-action recommendations
 - Channel optimization suggestions

Purpose: Enable data-driven CRM decision making.

Example Lifecycle Use Case

- Business Problem: 410K users are currently dormant.
- Hypothesi: Push notification fatigue is reducing re-engagement rates.
- Experiment:
 - Variant A: ₹500 Cashback Offer
 - Variant B: BOGO Lounge Experience
- AI Recommendation: Shift dormant users from Push to WhatsApp and RCS.
- Result (Prototype Simulation)
 - 98.4% confidence
 - +77.8% conversion lift
 - Estimated reactivation of 6,200 users
 - Estimated revenue impact of \$42,000

This illustrates how CRM can function as a measurable growth engine rather than a communication channel.

Prototype Screens

Screen 1: Overview Dashboard (A)

- This dashboard acts as the operational command center for CRM and growth teams. It provides visibility into key business metrics such as total installs, active users, dormant users, retention cohorts, and channel performance.
- The dashboard helps identify lifecycle bottlenecks by visualizing the customer funnel from app installation through activation and repeat engagement. It also highlights channel effectiveness across WhatsApp, Push Notifications, Email, SMS, In-App messaging, and RCS.

Screen 2: Segment Explorer Screen

- The Segment Explorer allows CRM managers to create dynamic user cohorts based on behavioral, demographic, and engagement signals.
- Instead of broadcasting campaigns to all users, teams can create highly targeted audiences such as dormant users, high-intent browsers, recent installers, or high-value customers.

- The platform also surfaces opportunity scores and preferred communication channels to help optimize campaign efficiency and reduce communication fatigue.

Screen 3: Journey Builder Screen

- The Journey Builder provides a visual workflow canvas for designing personalized customer experiences.
- Users move through automated pathways based on their actions and behaviors. Each journey consists of triggers, decision nodes, wait periods, communication actions, and exit conditions.
- The example shown demonstrates an onboarding activation journey where new users receive a welcome communication, are evaluated for conversion behavior, and are automatically routed through different engagement paths based on their response.

Screen 4: Campaign Composer Screen

- The Campaign Composer enables CRM managers to design campaign strategies by selecting target audiences, communication channels, incentives, scheduling windows, and personalized content.
- The integrated AI-powered copy generation engine assists in producing communication variants optimized for different customer segments and campaign objectives.
- A live mobile preview allows teams to visualize exactly how messages will appear to different user personas before deployment.

Screen 5: Experiments Screen

- The Experimentation Lab allows teams to validate marketing hypotheses before scaling campaigns to larger audiences.
- Different campaign variants can be tested against one another to evaluate which messaging strategy, offer structure, communication channel, or creative concept delivers superior business outcomes.
- The system automatically identifies winning variants, calculates performance lift, and provides confidence scores to support decision-making.

Screen 6: AI Strategy Screen

- The AI Strategy Room functions as an intelligence layer above the CRM platform.
- It continuously evaluates campaign performance, user behavior, communication fatigue, and channel effectiveness to generate actionable recommendations.
- Instead of manually analyzing reports, CRM managers receive prioritized suggestions for improving campaign performance and reducing churn risk.
- Recommendations can be accepted and applied directly to active lifecycle programs.

User Workflow

1. Diagnose performance through CRM Dashboard
2. Identify target cohorts in Segment Explorer
3. Build lifecycle journeys
4. Create personalized campaigns
5. Launch experiments
6. Evaluate results
7. Apply AI-generated optimization recommendations

The objective was not to build a production CRM platform, but to visualize how user behavior can be transformed into personalized lifecycle journeys and measurable business outcomes.
